
Contents

Introduction	7
I. Biology and Medicine	
1. DNA – the self-copying molecule	11
2. Genetically modified organisms	13
3. Gene sequencing	15
4. Ultrasonic imaging and ultrasound therapy	17
5. Computer tomography for bloodless cuts	19
7. Cardiac pacemakers – new life for weak hearts	21
8. Antibiotics – life-threatening life savers	23
6. MRI – “Seeing” with magnets	25
9. Virostatics – biochemical inhibitors of viruses	27
10. Prostaglandins – not a total disappointment	29
11. Tranquilizers – the stress-relief pills	31
12. The “Pill” – a sexual and social revolution	33
13. Smoking – involuntary suicide	35
II. Chemistry	
14. Sulfuric acid – unpleasant but indispensable	39
15. Soda ash – from glass worts to trona	41
16. Detergents – the super soaps	43
17. Potash – a vital mineral for plants	45
18. Nitrogen fertilizers to fight hunger	47
19. Phosphate – life-giving but in limited supply	49
20. Rare earths – rather abundant non-earths	51
21. Fluorine – the most aggressive element	53
22. Lithium – the lightest metal	55
23. The noble gases – not really inert	57
24. Explosives for construction and demolition	59
25. Dyes for a colorful world	61
26. Adhesives – from birch tar to epoxy resins	63
III. Electronics	
27. Paradigm shift with the transistor	67
28. Integrated circuits – revolutionizing everyday life	69
29. The thyristor – a triggered semiconductor switch	71
30. Organic semiconductors – for light and displays	73
31. Light emitting diodes – bright semiconductors	75
32. Liquid crystals – interface to the world	77
33. The CD – for audio and computer data	79
34. The USB stick – men’s jewelry	81
35. Digital photography – images are numbers	83
36. Radar – detecting and ranging with radio waves	85
37. GPS satellite navigation for everybody	87
38. Glass fibers instead of copper wires	89

IV. Energy	
39. Coal and biomass based liquid fuels	93
40. Bacterial bio-diesel	95
41. Bio-diesel from algae	97
42. Ethanol from sugar	99
43. Ethanol from starch	101
44. Ethanol from cellulose	103
45. Shale gas – an American energy revolution	105
46. Hydrogen – expensive and dangerous	107
47. Fuel cells – hydrogen-based electricity	109
48. Folding the fluorescent tube to save energy	111
49. Lithium-ion batteries	113
50. The heat-pump – using energy from the ground	115
51. Solar cells – clean and expensive	117
52. Wind – an unreliable power source	119
53. Sea waves – transformed wind energy	121
54. Uranium – energy from the atomic nucleus	123
55. Nuclear fusion – energy of the future	125
56. Steam power – still going strong	127
57. The Wankel engine – a sophisticated failure	129
58. Perpetual motion – an impossible concept	131
V. Informatics	
59. Antikythera – astronomical watch without a movement	135
60. Alan Turing – Computer pioneer and war hero	137
61. John V. Atanasoff and the electronic computer	139
62. ERMETH – home-made computer at the ETH Zurich	141
63. FORTRAN – scientific and technical programming	143
64. The PC – from desk to pocket	145
65. Supercomputers for bombs and weather forecasts	147
66. Cloud Computing – sky-high data	149
67. Artificial intelligence – expanding the natural kind	151
68. Computer chess – machine versus man	153
69. Robots – computer-controlled workers	155
70. The Internet – www and much more	157
VI. Aeronautics and Space	
71. The airship – romantic but uneconomical	161
72. Helicopters for vertical takeoff and landing	163
73. The jet – much faster flying	165
74. Detecting the stealth plane	167
75. Drones – for unmanned observation and killing	169
76. Sputnik I – starting space travel	171
77. Apollo's ride to the Moon	173
78. Weather satellites for accurate forecasts	175
79. Communication satellites – enormous data flows	177
80. Earth Observation from space	179

VII. Technology	
81. Infrared – more than cozy warmth	183
82. X-rays – for medicine and physics	185
83. The maser – predecessor of the laser	187
84. The laser – Einstein predicted it	189
85. The electron microscope – seeing atoms	191
86. A microscope for scanning atoms	193
87. The telescope – 400 years of development	195
88. Color TV – the preferred electronic medium	197
89. Piezocrystals – electricity under pressure	199
90. Luminescent materials – emitting and storing light	201
91. Superconductivity and zero resistance	203
92. Radiometric dating – from wood to basalt	205
93. Two revolutions in steelmaking	207
94. Zinc plating – fighting corrosion the classical way	209
95. The smartphone – computer-cellphone with camera	211
96. Do it yourself with three-dimensional printing	213
97. Repairing by replacing parts	215
98. Numerical control of machine-tools	217
VIII. Materials	
99. Ceramics long before the “Neolithic revolution”	221
100. Porcelain – old-fashioned high-tech composite	223
101. Concrete – engineering and art	225
102. Borazon – diamond’s “little sister”	227
103. Bio-ceramics – spare parts for the body	229
104. Floatglass – perfectly flat thanks to the tin bath	231
105. Glass ceramics for cooktops and supertelescopes	233
106. Carbon – the superlative material	235
107. Graphene – carbon-based electronics of the future?	237
108. Rubber – essential for mobility	239
109. Nylon – the first synthetic fiber	241
110. Polyvinyl chloride (PVC) – a sink for chlorine	243
111. Polyethylene – from toys to hip replacements	245
112. Polypropylene – a truly new polymer	247
113. PET – for fibers, bottles and foils	249
114. Polyurethanes – extremely versatile plastics	251
115. Teflon – the slippery plastic	253
116. Plexiglas – tough and elastic	255
117. Powder coating – painting without solvents	257
118. Foams for padding and dreaming	259
119. Aerogels – solid-state smoke	261
120. Gold – man’s very first metal	263
121. Copper – the metal from Cyprus	265
122. Modern man – a denizen of the Iron Age	267
123. Damascus steel – hard and flexible	269
124. Stainless steel – the poor man’s precious metal	271
125. Superalloys – indispensable for flying	273

126.	Titanium – Formula 1 bolides and eyeglass frames	275
127.	Tantalum – for capacitors and superalloys	277
128.	Aluminum – a metal extracted from clay	279
129.	Platinum – useful, beautiful and expensive	281
130.	Hard metal – hard but not a metal	283
131.	Metallic glass – for transformers and implants	285
132.	Silicon – a wonderful gift of nature	287
	 IX. Measuring Time	
133.	Measuring time mechanically	291
134.	Su Sung’s celestial machine	293
135.	The astronomical clock of the Strasbourg cathedral	295
136.	Speedmaster – the Moonwatch	297
137.	The Crystal Clock of Horton and Marrison	299
138.	The Quartz wristwatch – a technical revolution	301
139.	The Swatch after 400 million pieces	303
140.	The G-Shock – almost unbreakable	305
141.	Quartz movements for clocks	307
142.	Radio controlled watches – guaranteed exact time	309
143.	The atomic clock – replacing the solar day	311
144.	The optical clock – time as a cosmic dimension	313
145.	A chip-size atomic clock	315
146.	Developing the ultimate wristwatch	317
147.	The Smartwatch – freedom for the left hand	319
